Engineering Creative Solutions for Fluid Systems Since 1901
A Tradition of Excellence
With the development of the first rubber seated butterfly valve more than 70 years ago, the Henry Pratt Company became a trusted name in the flow control industry, setting the standard for product quality and customer service. Today Pratt provides the following range of superior products to the water, wastewater and power generation industries.

**Butterfly Valves:** from 3” to 162”

**Rectangular Valves:** 1’ x 1’ to 14’ x 16’

**Ball Valves —**
**Rubber Seated:** from 4” to 60”
**Metal Seated:** from 6” to 48”

**Plug Valves:** from 1/2” to 36”, 3 ways

**Hydraulic Control Systems**

**Valve Controls**

**Energy Dissipating Valves**
**and Fixed Energy Dissipaters**

**Cone Valves**

**Check Valves**

A Commitment to Meeting The Customers’ Needs
Henry Pratt valves represent a long-term commitment to both the customer and to a tradition of product excellence. This commitment is evident in the number of innovations we have brought to the industries we serve. In fact, the Henry Pratt Company was the first to introduce many of the flow control products in use today, including the first rubber seated butterfly valve, one of the first nuclear N-Stamp valves, and the bonded seat butterfly valve.

Innovative Products For Unique Applications
Though many of the standard valves we produce are used in water filtration and distribution applications, Pratt has built a reputation on the ability to develop specialized products that help customers to meet their individual operational challenges.

Creative Engineering for Fluid Systems
Pratt’s ability to provide practical solutions to complex issues is demonstrated by the following case histories.

Earthquake Proof Valves
Pratt designed and manufactured hydraulically actuated valves for a water storage application so that the valves would automatically operate in the event of earthquakes. This lead to the development of a valve that will withstand acceleration forces of up to 6g’s.

Custom Actuation/Isolation Valves
Pratt designed and manufactured valves that would isolate a working chamber in the event of a nuclear emergency during the decommissioning of armed nuclear warheads. The valves were able to close in a millisecond using specially designed Pratt electro-pneumatic actuators.

Valves Designed for Harsh Environments
Pratt designed and manufactured a 144” diameter butterfly valve for the emergency cooling system at a jet engine test facility. The valve was designed to supply water to help dissipate the tremendous heat generated by the engines during testing.

Through experience, commitment and creative engineering, Pratt is uniquely suited to provide superior products for our customers’ special needs. For more information, contact our corporate headquarters in Aurora, Illinois.

Introduction to Energy Dissipating Valves

Over the years, Pratt has maintained a commitment to product innovation by designing water control valves that improve our clients’ processes and reduce their operation and maintenance costs. Our products are developed to meet and surpass even the most difficult specifications.

By adding sleeve valves, fixed cone valves, and energy dissipaters to our product line, Pratt continues to expand our offering to those customers who require specialty valves for applications where there is zero back pressure, cavitation or high flow rates.

Scope of the Line: Model 117 Fixed Cone Valve

- Available in sizes 6 inches and larger
- Welded steel or stainless steel construction
- Nitronic 60 drip tight seat
- Contoured ribs with Nitronic 60 overlay
- Epoxy coated interior
- Available with or without hood

Contoured ribs on the internal of Model 117

Metal-to-metal seat without hood

| Nitronic 60 stainless steel seat | • Self-aligning  
 • Gall, abrasion, and erosion resistant                                      |
| Contoured cone and rib design   | • Provides vibration free operation  
 • Prevents pressure fluctuations                                                  |
| Circular flow pattern      | • Uniform flow pattern without turndown limitations                           |
| Optional hood             | • Offers flow discharge into confined areas  
 • Can be secured to the fixed cone or outlet structure                            |
| Ease of maintenance      | • Can be performed while the valve is in line                                |
**Cone Valve Applications**

The Model 117 Fixed Cone Valve is used to regulate flow from dams and reservoirs. It is a free discharge valve that is commonly used as a turbine bypass valve, reservoir drain, or continuous discharge flow control valve.

The Model 117 has a fixed cone with contoured ribs that eliminate the vibration problems associated with other fixed cone designs. Flow is controlled by movement of an external stainless steel gate which has a drip tight metal-to-metal shut off against the Nitronic 60 seat.

When discharging into the atmosphere, the jet spreads out in a wide cone angle and breaks up into a fine spray. If containment of the jet is desired, a hood can be installed which concentrates the flow.

---

**Sizing a Model 117 Fixed Cone Valve**

To determine the valve size it is necessary to calculate the desired flow rate. The flow rate can be calculated as follows:

\[ Q = C_d \times (2gH)^{1/2} \times A \]

- **Q** = Flow (cfs)
- **C_d** = Discharge Coefficient (.86 max)
- **A** = Cross-sectional Area of the pipe ID (square feet)
- **g** = 32.17 ft/s²
- **H** = Upstream Head (feet)

- For velocities 0-50 fps maximum epoxy coated carbon steel construction is provided
- For velocities 51-100 fps maximum stainless steel construction is provided

---

*Note: All dimensions are approximate and should be used for estimating purposes only. Exact dimensions will be supplied on submittal drawings.*
Suggested Specification for Fixed Cone Valves

General Specifications
The fixed cone valve shall be as manufactured by the Henry Pratt Company or approved equal.

Design
The valve shall be designed as a free discharging fixed cone valve capable of operating throughout its range without cavitation or vibration. The valve shall be metal-to-metal seated achieving drip tight shut off.

Valve Body
The body will be of a cylindrical design with an upstream flange for connecting to a conduit/pipe. The downstream end will contain a floating metal conical seat ring designed to isolate it from stresses that can cause distortion. The body will incorporate four vanes designed as stabilizers to allow the valve gate to travel from open to closed without vibration. The conical seat will be field replaceable without removing the valve from the line. The body will contain a rear seal groove to seal the sleeve gate and prevent leakage during operation.

Valve (Sleeve) Gate
The sleeve gate is cylindrical and uses a linear motion to open and close the valve. Seating is achieved by an internal sealing surface which contacts the body seat at the end of its stroke.

Hoods
When a hood is required to direct the discharge flow stream it should be attached to the valve body. Hoods attached to the valve gate (sleeve) shall not be allowed.

Actuation
Fixed cone valves can be actuated using either electric motors, hydraulic cylinders or manual actuators. The chosen method shall be sized to perform the function for which it is required. Actuators shall conform to AWWA C540.

Testing
The valve shall be hydrostatically tested at two times working (rated) pressure for 30 minutes and shall show no sign of leakage at the welded areas or through the body. The body and gate (sleeve) seat when in the closed position shall be drip tight.

Painting
Before coatings are applied, blast clean all unmachined areas to SSPC-SP10 standards. Coat surfaces with two coats of high solids epoxy paint or the engineer’s recommended coatings.
